

System architecture

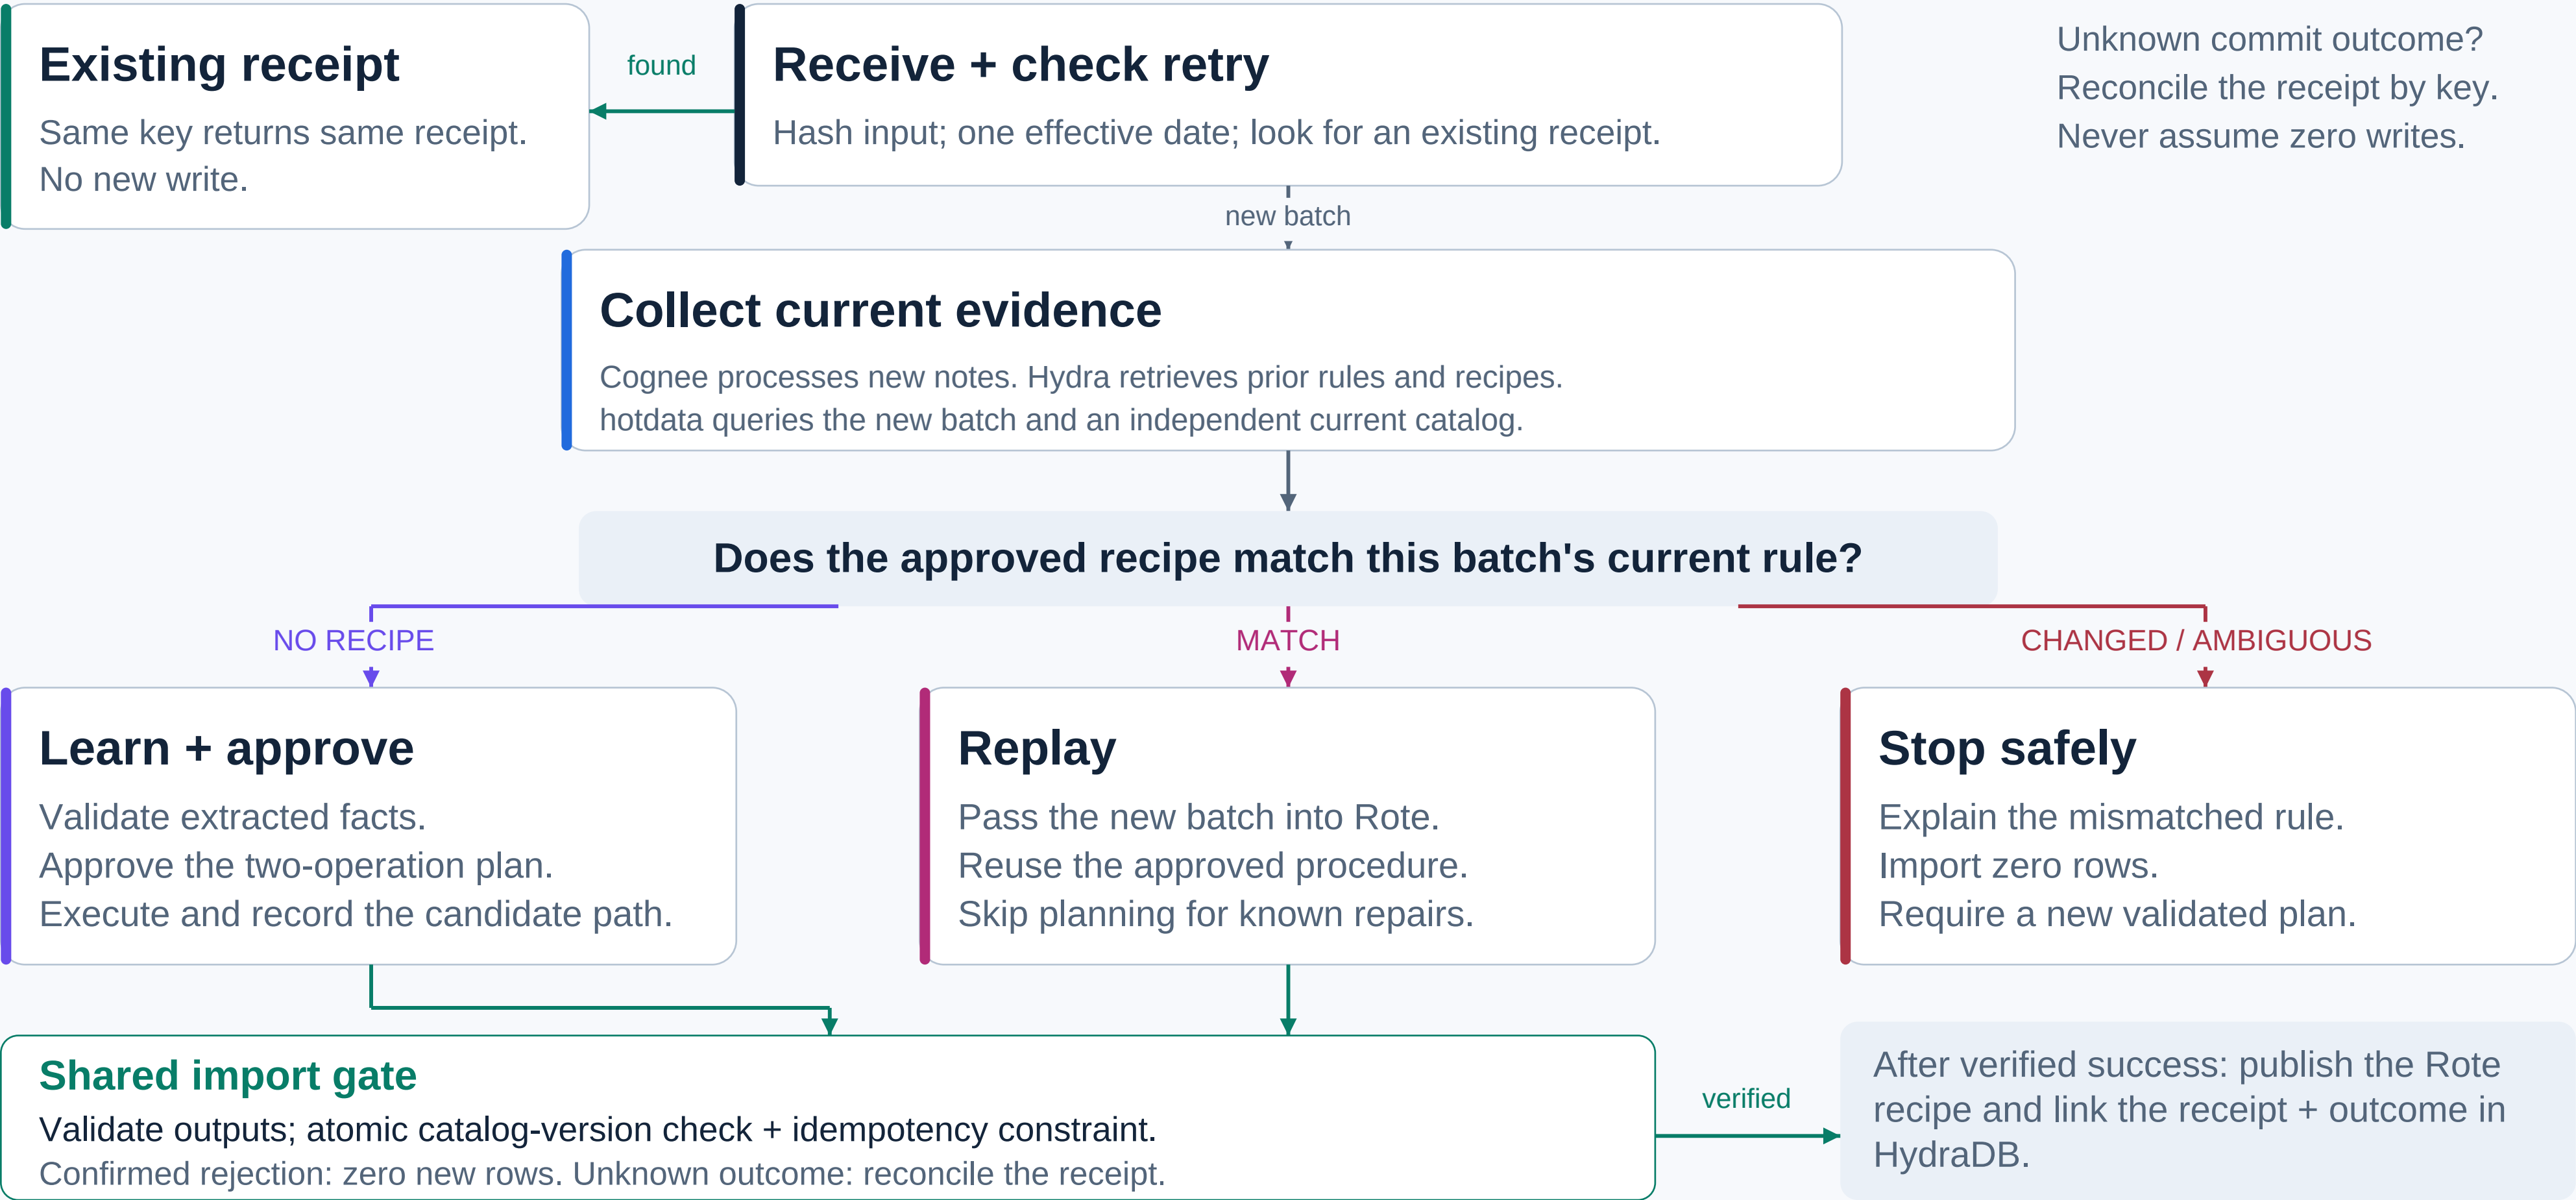

One operations agent learns a supplier's rules, reuses the procedure, and stops when the rule changes.

Snyk build gate: source + dependency scans, fixes and rescans before submission.

System flow

RocketRide orchestrates the runtime. Reuse requires fresh evidence and matching procedure preconditions.

Unknown commit outcome?
Reconcile the receipt by key.
Never assume zero writes.

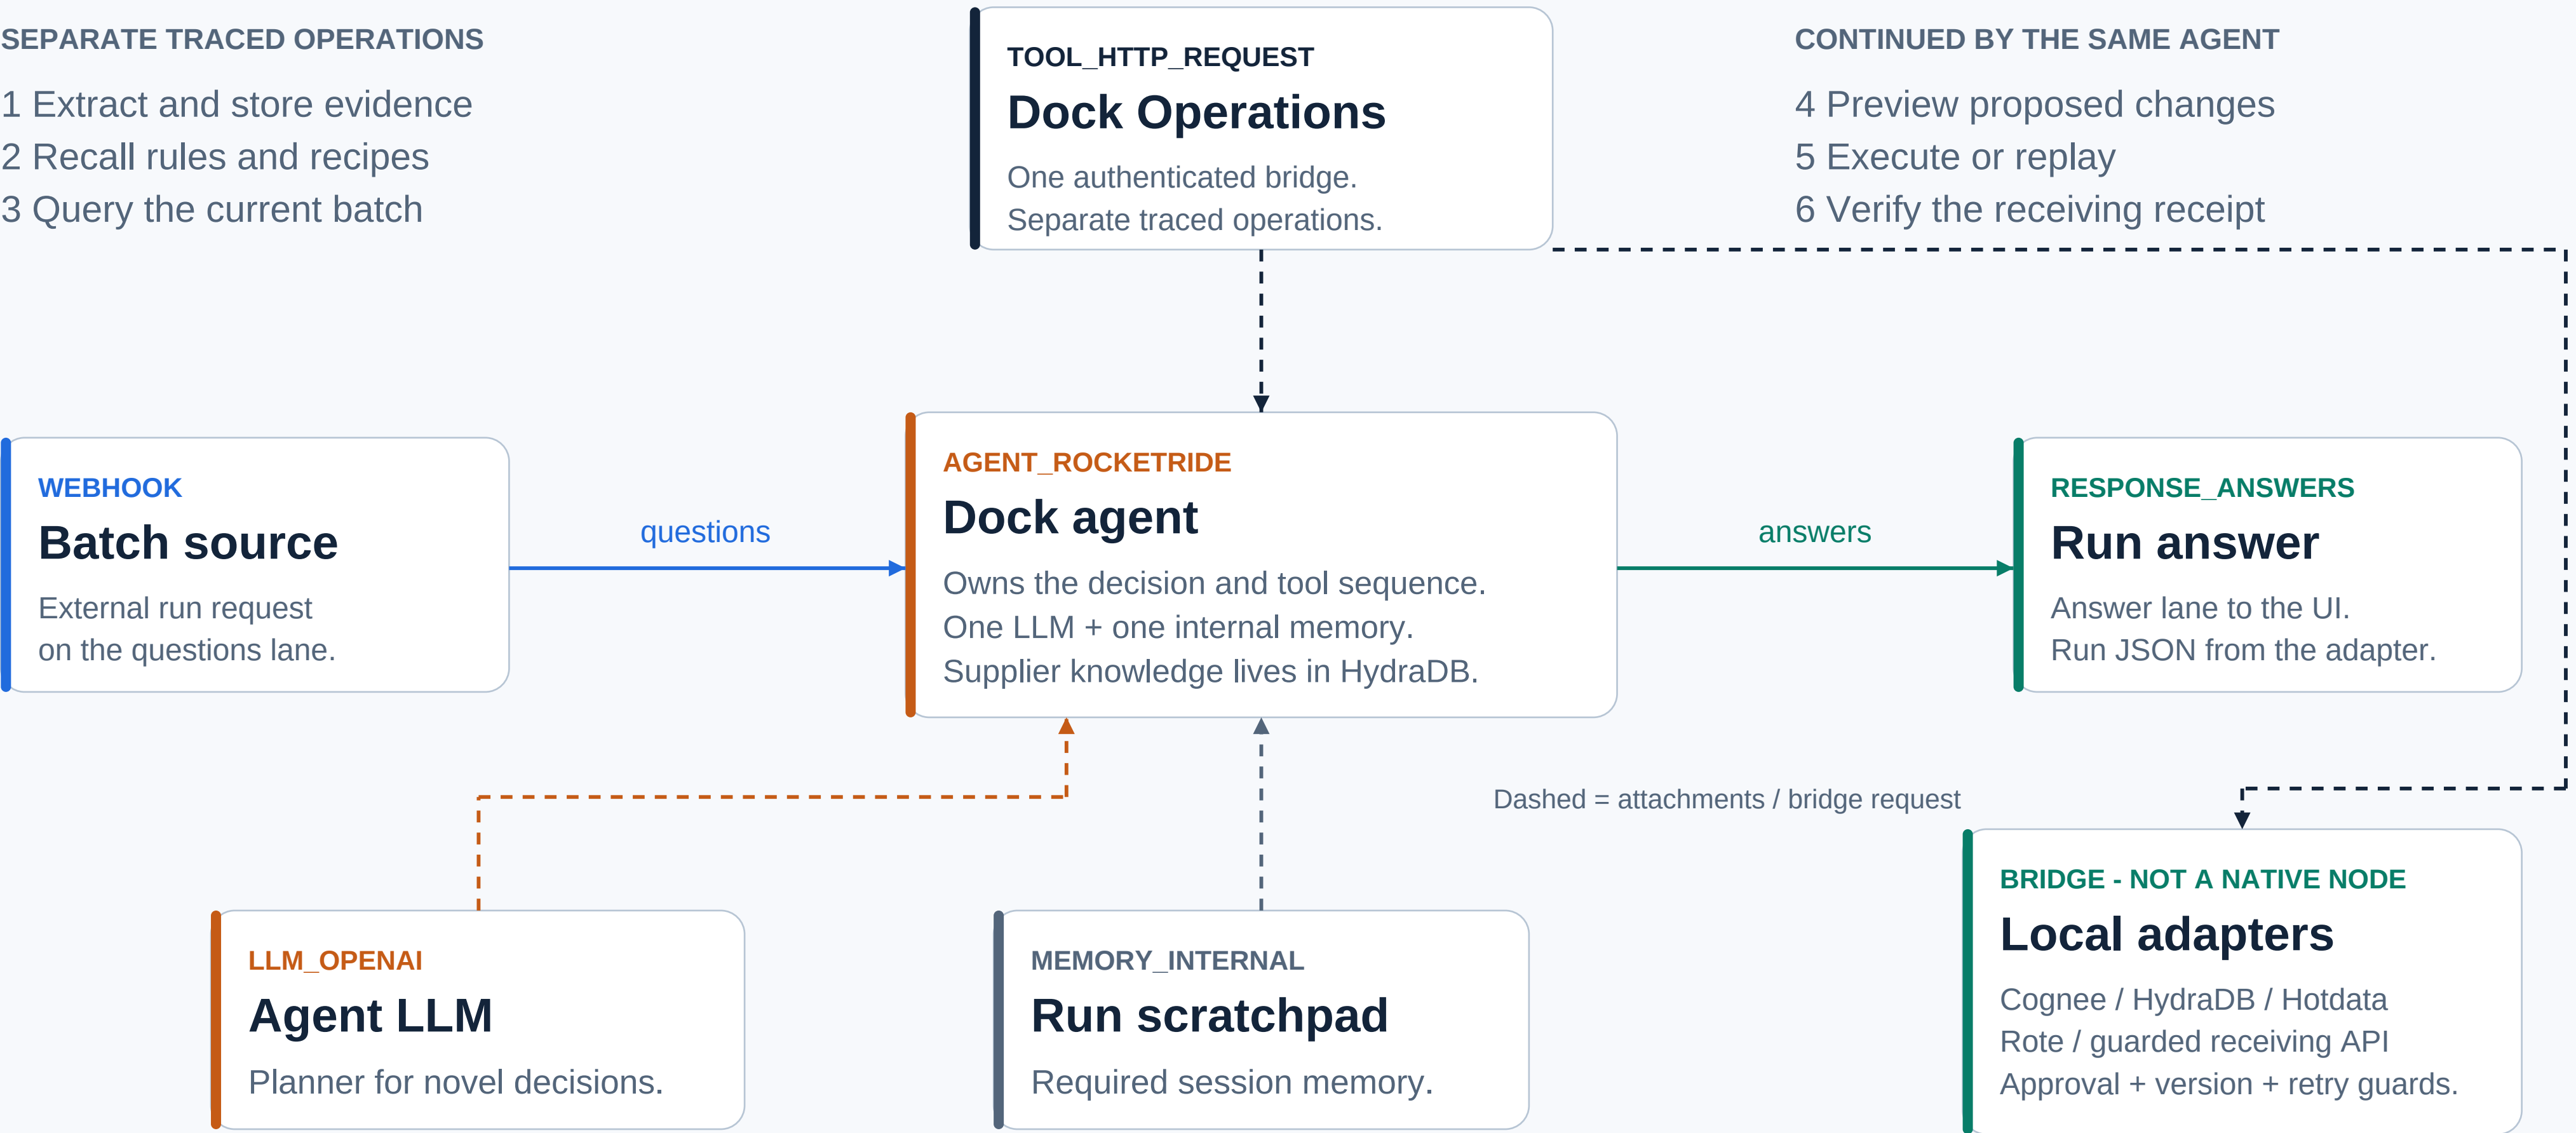

Outside runtime: Snyk scans source and dependencies; findings feed fixes and rescans.

The RocketRide Designer view

A concrete node blueprint based on the installed staging catalog. Full Dock pipeline validation is still required.

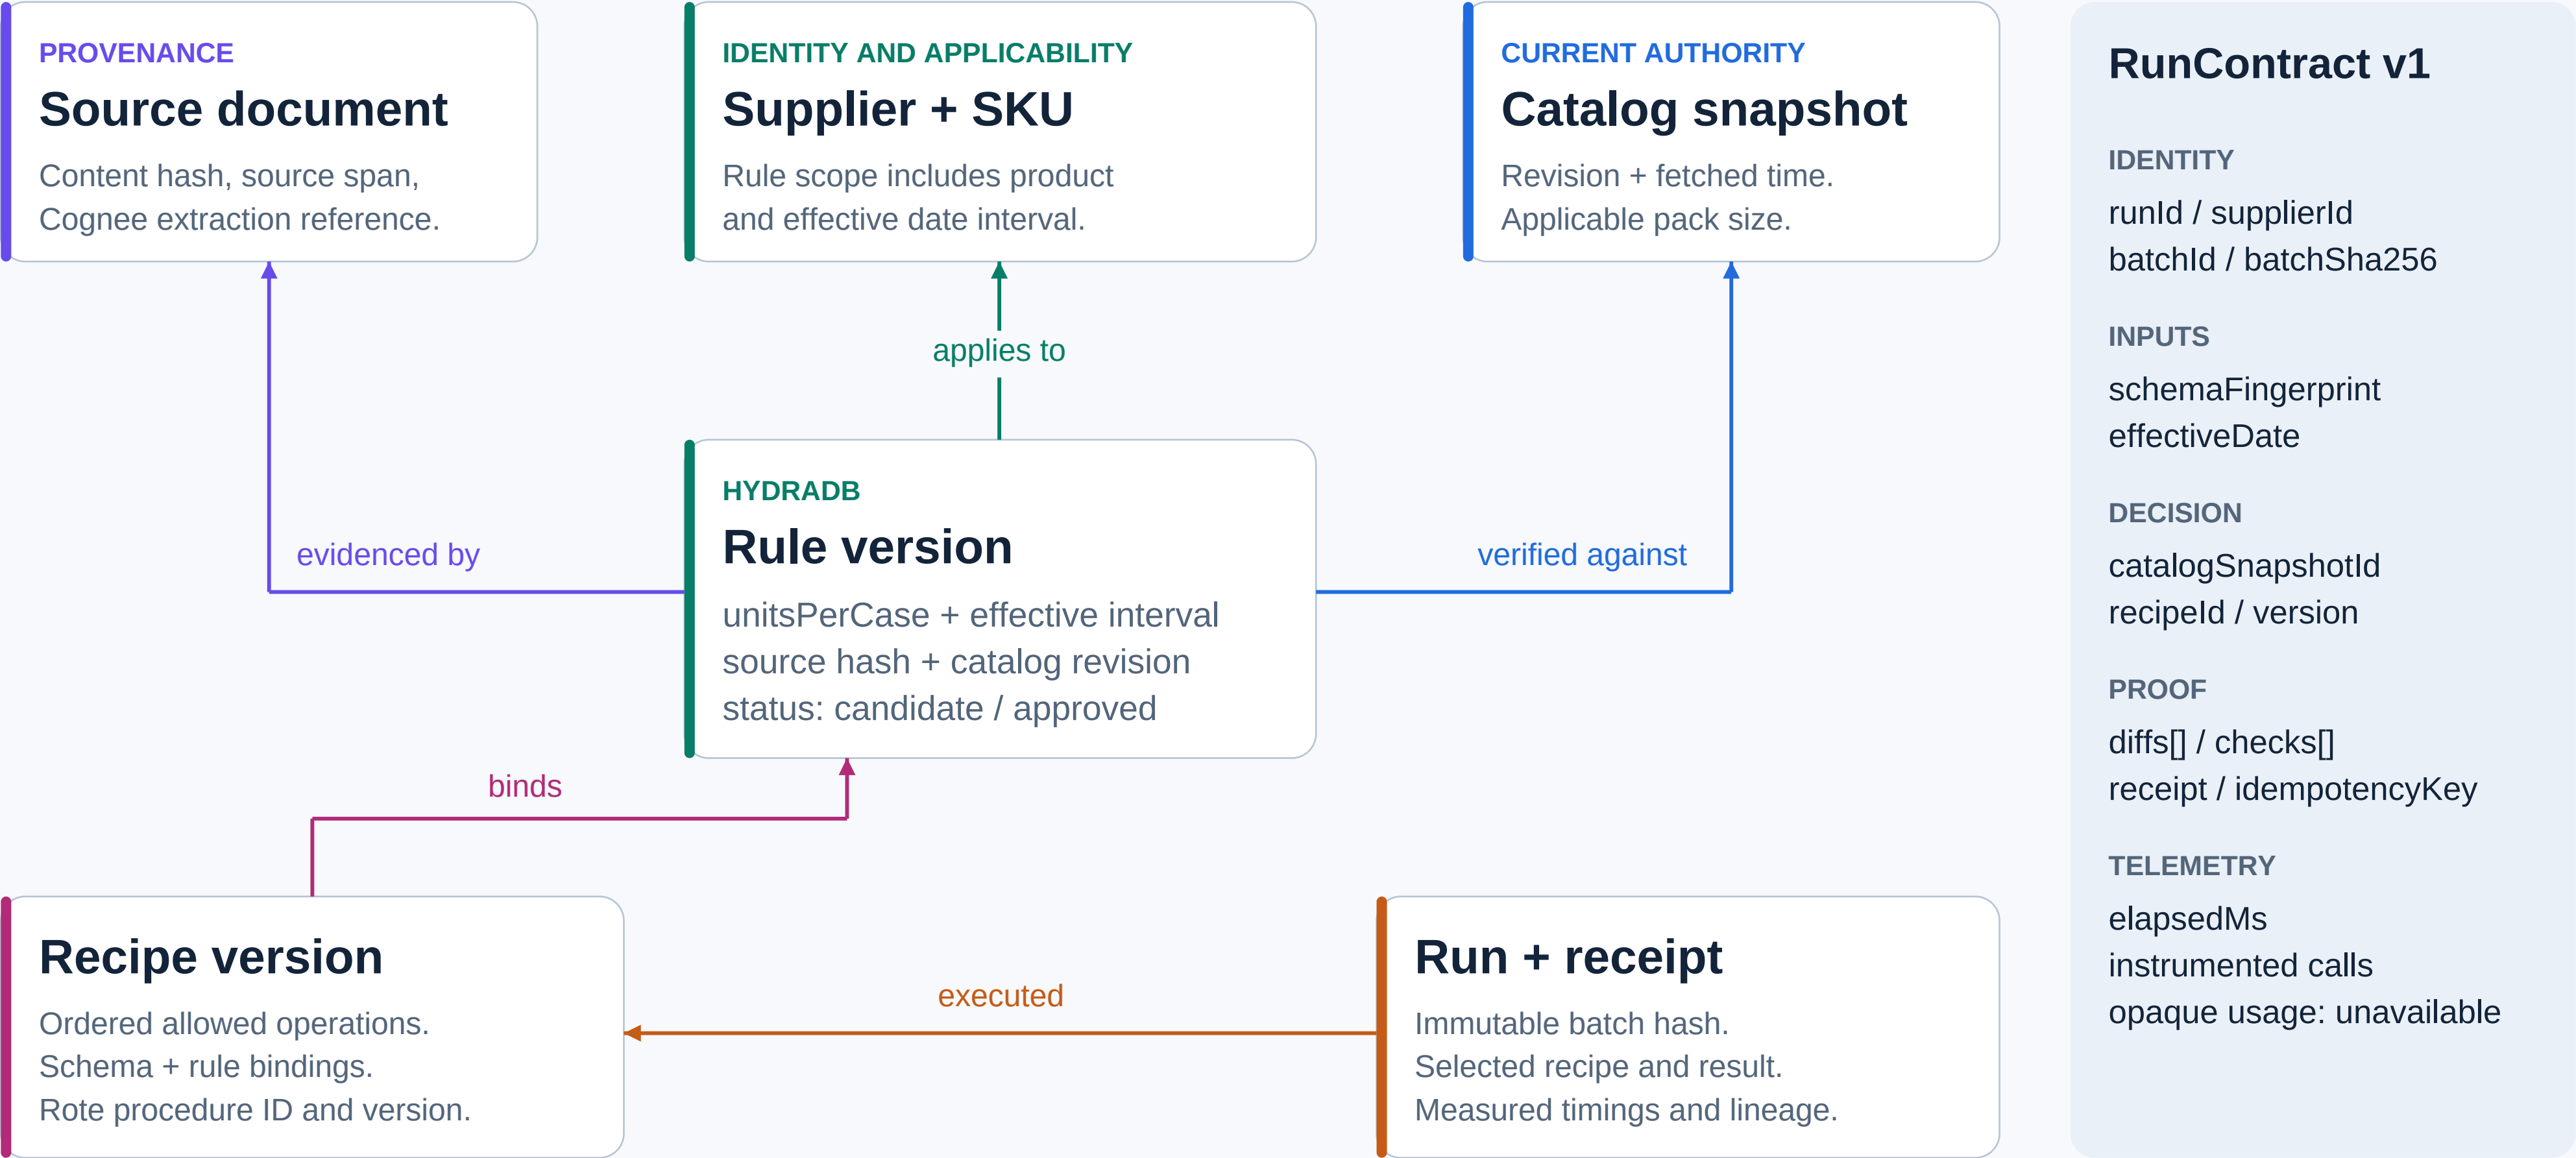

SEPARATE TRACED OPERATIONS

- 1 Extract and store evidence
- 2 Recall rules and recipes
- 3 Query the current batch

Memory model and run contract

Candidate facts become operational rules only after validation against the current authoritative catalog.

Six-hour build map

Two people, shared contracts, one thin end-to-end path before polish.

	0:00	1:00	2:00	3:00	4:00	5:00	6:00
YOU + CODEX Memory, evidence and batch validation	Agree API + check	Cognee -> Hydra Hotdata checks	Learn + first import	Replay integration	Changed-rule proof	Snyk + demo + buffer	
TEAMMATE + CODEX Execution, receipts and product screen	Agree API + check	Receiving API RocketRide path	Approve + record run	Rote replay new batch	Guards + retry test	Snyk + demo + buffer	

THE THREE-MINUTE PROOF

01 Learn

10 cases x 12 = 120 units.
Show source evidence + first receipt.

02 Replay

New batch: 7 cases x 12 = 84 units.
Show reused procedure + actual timing.

03 Stop

Pack size changes from 12 to 6.
Show mismatch + zero imported rows.

Build gates and proof of correctness

The target architecture is ready to implement. Individual setup checks are not a working five-tool application.

LAYER	VERIFIED SETUP	NEXT ACCEPTANCE GATE
Cognee	Cloud funded; local bundled demo passed	Fresh hosted ingest + extracted graph export
HydraDB	Local graph write and traversal passed	Store and query Cognee-derived rules
hotdata.dev	CLI installed; browser sign-in completed	Clear account activation; run real batch SQL
RocketRide	Staging auth + echo validation passed	Compute credits; HTTP bridge; pipeline smoke test
Rote / Modiqo	Login + official Hello warm-up passed	Record / replay the actual guarded import path
Snyk	Source scan completed: 0 findings	Six dependency advisories remain open

Execution invariants

Fresh rule checks / Immutable inputs / Two allowed repairs / Atomic imports / Measured proof / No hidden findings
